

- Automatically searches an entire application
- Automatically locates any text string within a database design element or document
- Automatically replaces each found instance
- Allows you to review found items within their context

Teamstudio® Configurator

Automated search and replace for Lotus Notes® application development

Teamstudio Configurator allows users to search and replace text across an entire database, either in a design or documents. Automating this potentially error-prone, repetitive task significantly enhances application quality, and alleviates developer frustration, allowing them to concentrate on more complex problems to make better use of their skills.

Development without Configurator...	Development with Configurator ...
Are you tired of manually searching throughout your application to find specific text?	You can automatically search an entire application, including buttons, forms and shared actions and documents.
Are you faced with more advanced search problems, such as trying to locate all URLs, and don't have the time to look at every line of code?	You can automatically locate any text string within a Notes® database design element or document using modifiers such as whole word, accent, case or wild cards.
Once you have found all instances of your search text, can you easily replace them, or must you replace each instance manually?	You can automatically replace each found instance, either one at a time or all at once.
Are you using other search and replace methods, but aren't sure if all text replacements are appropriate because you can't see them in context?	You can review found items within their context using a two-pane window, with the element rendered in the top pane and the found text in the bottom pane, allowing you to quickly determine if a change is appropriate.

Customized Configurator Solutions

If you have a large-scale enterprise-wide project, Teamstudio Consulting can provide a customized Configurator solution. For example, our consulting team can perform a focused search and replace, customize Configurator to meet your specific needs, or add search and replace capabilities to your end user application.

Use Teamstudio Configurator to search different parts of a database, including the design and/or documents. For each occurrence, Teamstudio Configurator prompts you with the search term highlighted in the context that it was found.

System Requirements

Client and Server

Processor and memory specification per typical Notes or Domino® installation
Microsoft Windows 95/98/NT4/2000/XP (as supported by Notes) on Intel (x86) platforms
Lotus Notes R4.x, R5.x, R6.x or R7.x
